

Pioneering for You

wilo

Wilo Philippines – 60 Hz

Drainage and Sewage Pumps

Pumps and pump systems for drainage and sewage, waste water collection, transport and dewatering.

Pioneering for You.

Our promise to you.

WILO SE is one of the world's leading premium suppliers of pumps and pump systems for building services, water management, and the industrial sector. With over 7800 employees in more than 60 subsidiaries around the world, we develop smart solutions that connect people, products and services to effectively support you in your daily work. "Pioneering for You" is our lasting commitment to clear customer focus, unrelenting pursuit of quality and our special passion for technology.

As the digital pioneer of the pumps industry, we understand the challenges that will shape the future. As an innovation and technology leader, we provide holistic solutions to address them. We know that these issues play a major role in your daily work and, in turn, ours too.

Sustainably better.

One of the most pressing tasks in times of limited natural resources is the responsible consumption of water, a resource that is becoming increasingly scarce. Efficiency, connectivity and safety will become increasingly important in the future. We aspire to offer you sustainable, user-friendly and high-performance solutions for building services and water management that are ahead of their time. We work closely with our customers to create innovative products and systems that perfectly match their requirements and are rounded off with convenient services. The result is integrated solutions you can rely on at all times.

DISCOVER WILO SOLUTIONS.

WILO offers a wide variety of intelligent pumps and systems to make our users' everyday lives simply more pleasant. Our energy-efficient solutions are suitable for residential, public and commercial properties. Wilo products are used in heating, air conditioning, cooling and water supply applications as well as for drainage and sewage..

HEATING, AIR CONDITIONING, COOLING

Wilo delivers individual solutions and highly efficient technology for applications in heating, air conditioning, cooling and domestic hot water.

WATER SUPPLY

Innovative products and systems from Wilo support applications in rainwater utilisation, water supply and pressure boosting, firefighting and raw water intake.

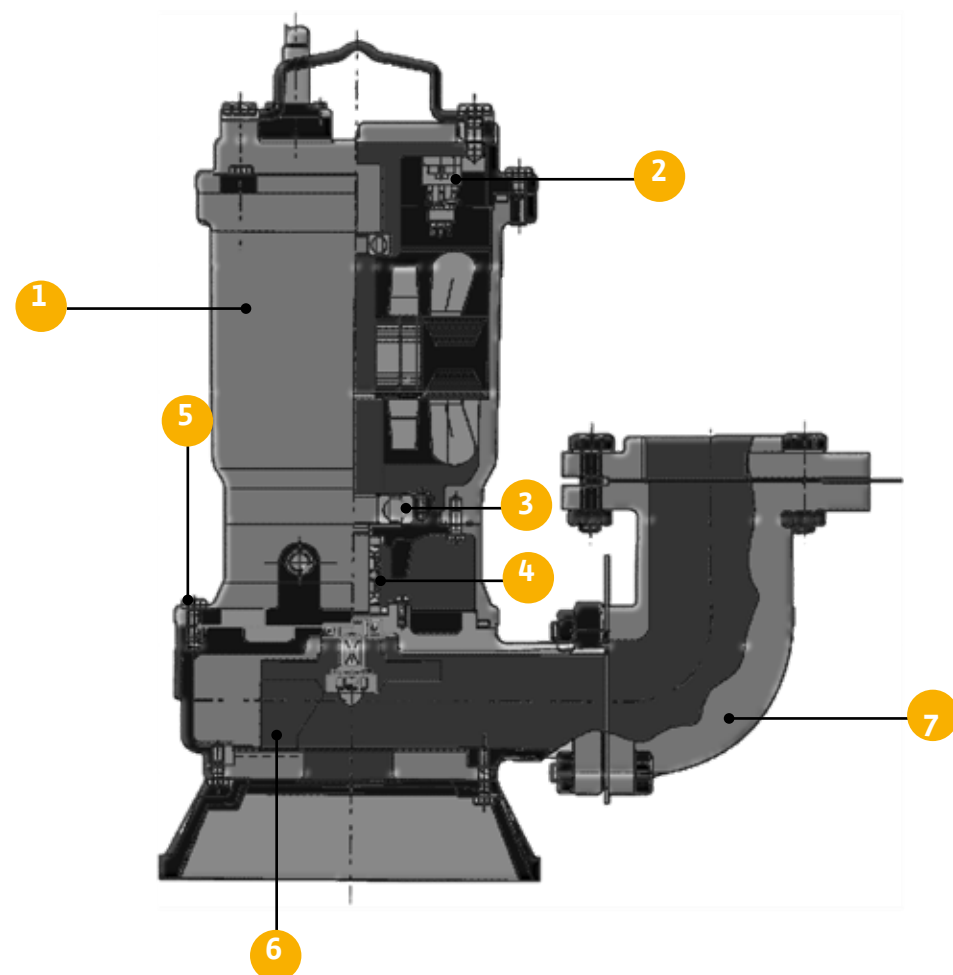

DRAINAGE AND SEWAGE

Wilo pumps and lifting units ensure safe and reliable operation in wastewater and sewage disposal.

DRAINAGE AND SEWAGE

Drainage Pump Structure

1. Motor

→ Submersible motor

2. O.L.P. or T.P

→ Overload protection or thermal protection

3. Bearing

→ Bearings

4. Mechanical Seal

→ Double mechanical seal
→ Motor: Ceramic and carbon
→ Pump: Sic and Sic

5. Bolts & Nuts

→ Stainless steel bolts and nuts

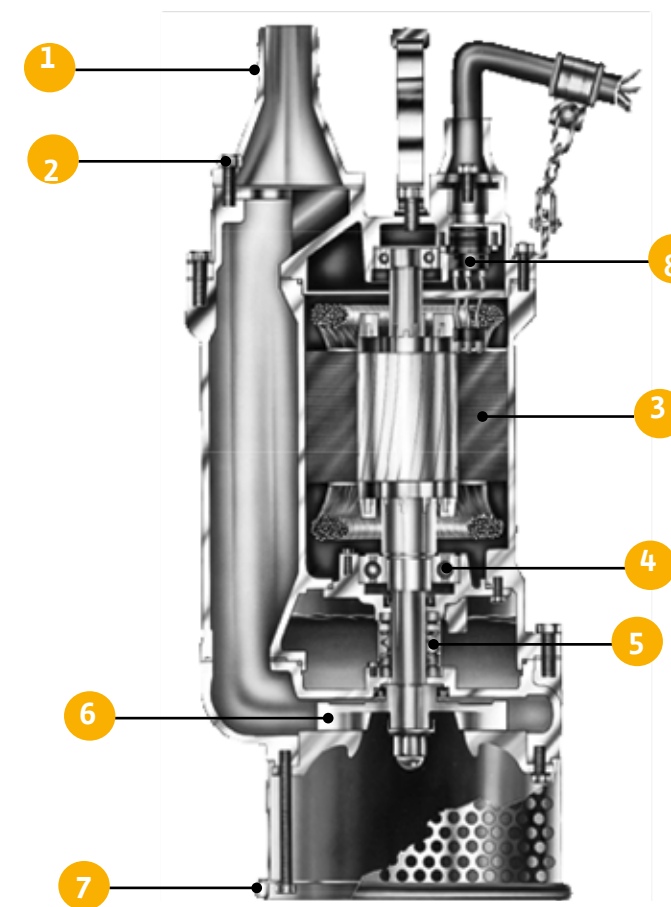

6. Impeller

→ Volute : Drainage
→ Vortex/Non-clog/cutter: waste water

7. Elbow & Auto Guide Rail System

Elbow and auto coupling device
AD-50 - 150
AD-50-500
→ PD(V)-A(S) Series
→ PD-G Series
→ PD-200/350 Series
→ PH-H751 Series
→ PDV-270 Series
→ DLV-270 Series
→ TS32/10.TS40/13 Series

Contractor's Pump Structure

1. Hose of Flange Coupling

Hose or flange connection
→ DN50-150

2. Bolts & Nuts

→ Stainless steel bolts and nuts

3. Motor

→ Submersible motor

4. Bearing

→ Bearings

5. Mechanical Seal

→ Double mechanical seal
→ Motor: Ceramic and carbon
→ Pump: Sic and Sic

6. Impeller

→ Semi-open type impeller

7. Bottom Plate

→ Strainer and bottom plate

8. Over Load Protector (O.L.P)

→ Overload protection as an option

PD/TS Series

80W-950W-Volute Type

PD-200, 300, 550 760 M(A/LA)

Features

- Minimum residual water-level.
- Integrated motor cooling
- Weight lightning and easy transportation
- Double sealing system (Mech seal & oil seal)

Application

- Drainage for water tank, basement and handy sewage facility, general usages, wastewater treatment, construction site agriculture and flood control.

PD-A401, PD-S401, PDS75, PD-401 (M/MA/MLA)

Features

- Powerful performance
- Stainless steel shaft.
- Perfect sealing with double mechanical seal and oil seal.
- Thermal protection.

Application

- General drainage.
- Drainage form building basement & flood control.
- Drainage for construction site.

PD-G050 (M/MA)

Features

- Corrosion resistance for all wet parts.
- Minimum residual water-level.
- Portable usage due to lifting handle
- Easy removable strainer for cleaning dirt particles

Application

- Drainage for water tank in building and aquarium.
- Drainage for basement and residual water.
- Sewage from sink.

PD Series

1.5~15KW - Volute Type

PD-Series (1.5~15kW)

Features

- Powerful performance up to max head (21m) and flow rate (l 550) in 2HP range.
- Stainless steel shaft.
- Perfect selling wit double mechanical seal and oil seal.
- Thermal protection.

Performance Curve

Application

- General drainage with solids (solid size: under strainer suvtion bore)
- Drainage for waste water treatment and small disposal facility.
- Drainage for small fountain and artificial water falls.
- Drainage for agriculture and horticulture.
- Drainage for underground commercial facility, building basement, mahine room and sanitation as well as under-ground leachate.

PDV/PDX Series

300~30KW - Vortex Type

PDV/PDX-Series

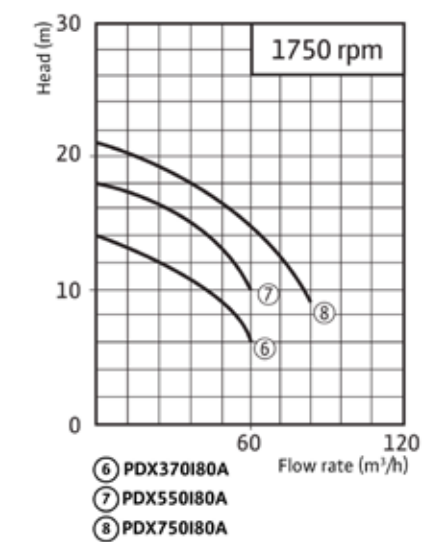

Features

- Stainless steel and engineering plastic materials
- Easy transportation and installation.
- Triple sealing design with packing
- Applying double mechanical seal made of silicon carbide and oil seal.

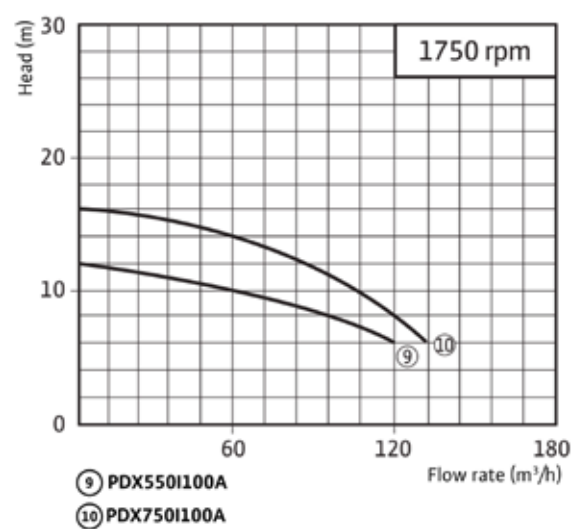

Application

- Drainage and sewage for basement.
- Drainage and sewage for wastewater from farms as well as human waste.
- Drainage and sewage for wastewater and sewage treatment.
- Wasterwater transport with solida content.

DLV Series

0.95~15kW - Non-Clog & Cutter Type

Performance Curve

DLV-300MA

Features

- Odor-free due to perfect sealing a tank with silicon gasket.
- Space saving design.
- Easy maintainabce with avortex type (free passage).
- Sewage lifting unit.

→

Application

- Disposal of sewage that cannot be discharge naturally to the sewer system.
- Disposal of sewage in a (semi) basement for residential and industrial purposes.

Model	Power Source	Output (W)	Discharge (mm,inch)	Head (m)	Flowrate (l/min)	Operating Volume (l)
DLV-300MA	Single Phase 220V, 60Hz	300	∅32 (1 1/4")	9	200	23

PDN/PDV/PDC Series

0.95~15kW - Non-Clog & Cutter Type

PDN/PDV/PDC-Series

Features

- Leak proof by double mechanical seal and oil seall.
- Motor protection by thermal protector.
- Excellent sludge transfer by non clog type.
- Safety design with built-in overload protection.
- Variuos materials are available.

Application

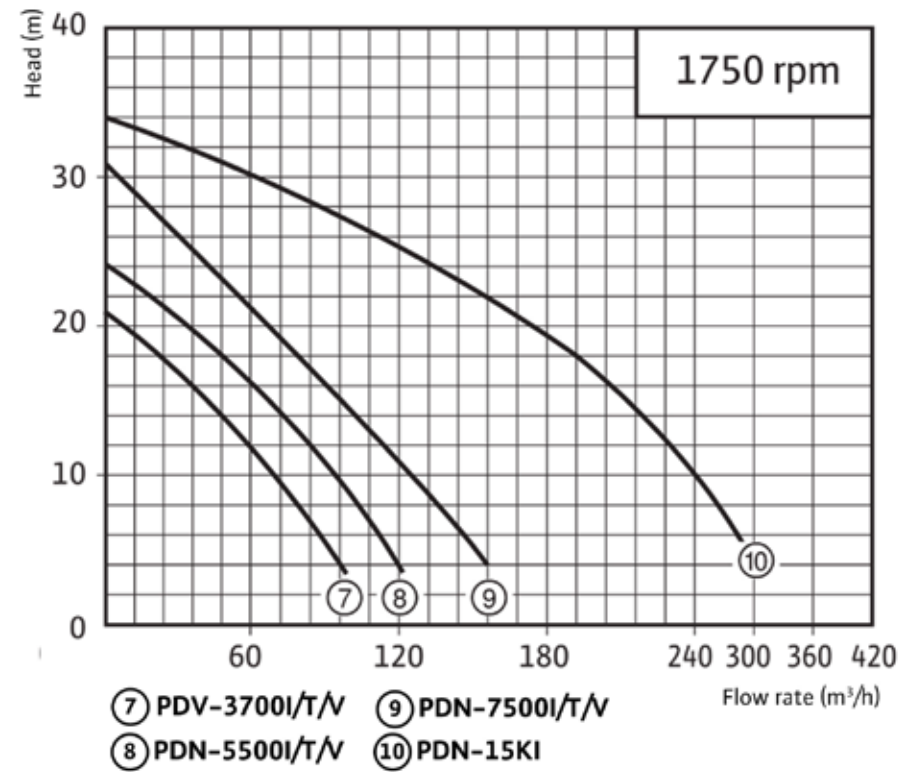

- Drainage for waste water factories and waste treatment plant.
- Delivery of sewage at sewage treatment plant, human waste treatment.
- Drainage for buildings.
- Treatment utility drainage.

PDU Series

3.7~15kW-Light Duty

PDU Series

Features

- Top discharge arrangement allows easy access into areas with space limitations.
- Portable or permanent installation.
- Double Mechanical seals
- Light weight and thermal protection.

Application

- Drainage of tunnels, excavation pits, subway construction site, storm water and civil engineering works.
- Mobile use for contractors, installer and service industries.

Which aspects are to be observed during application in the building services?

Both the sewage generated in a building or on a piece of land and the rainwater which accumulates on courtyard and roof surfaces should be pumped to the sewer system with the aid of pumping stations and lifting units, insofar as they do not flow naturally downhill into the local sewage network. There are different ways to dispose of this sewage, depending on the respective fluids to be pumped. Wilo submersible pumps and sewage lifting units are designed especially to meet these different requirements and comply with currently valid EN standards. Dimensioning must be carried out in accordance with DIN EN 12050/12056 – Drainage stations for buildings and sites. A distinction is made here between sewage emerging from discharge points above the local backflow level, which must be guided to the public sewer system by taking advantage of natural declines, and sewage from discharge points whose water levels in the anti-siphon trap lie below the local backflow level. The backflow level is defined in bylaws. The upper street edge is usually taken as a rough guide value. Sewage (rainwater and wastewater) that accumulates below the backflow level must be conveyed to the public sewer system via automatically operating lifting units – Wilo sewage lifting units or Wilo submersible pumps.

The following details, among others, are to be observed for system dimensioning and design in accordance with DIN 1986-100, EN 12050 and EN 12056:

- Lifting units are to be designed in terms of performance in such a way that a minimum flow velocity of ≥ 0.7 m/s is guaranteed for the prescribed nominal diameters of the pressure pipe.
Prescribed minimum nominal diameters:
Sewage lifting unit for sewage containing faeces without comminution unit: DN 80
Sewage lifting unit for sewage containing faeces with comminution unit: DN 32
Sewage lifting unit for sewage free of faeces: DN 32
Sewage lifting unit for limited use for sewage containing faeces without comminution unit: DN 25
Sewage lifting unit for limited use for sewage containing faeces without comminution unit: DN 20
- The pressure pipe of a lifting unit must be equipped with a non-return valve and installed with its invert above the backflow level (backflow loop). The pressure pipe may not be connected to wastewater downpipes.
- Wastewater gate valves (supply and pressure sides) are to be installed in accordance with DIN 1986-100, EN 12050/EN 12056.
- Ventilation lines for lifting units are to be guided to heights above the roof level; the minimum nominal pipe diameter is DN 70 for sewage lifting units.

- Inlet pipes are to be installed with sufficient slope (a minimum of 1:50).
- It is practical to install pipes flexibly through masonry.
- An automatic standby pump is to be provided if the sewage drain pipe does not allow for interruptions.
- Switchboxes and signalling systems are to be installed at a dry, easily accessible position. The signalling system is to be mounted at an observable position.
- Lifting units must be serviced regularly. At least:
1x per year in single-family homes
Every six months in apartment buildings
Every three months for systems in commercial buildings
- The installation area is to be provided with sufficient ventilation and lighting. A working space of at least 600 mm is to be provided above and next to all operating elements and all parts requiring maintenance. The lifting unit must be provided with anti-buoyant mounting.
- Sewage containing mineral oils or explosive admixtures must be guided through oil precipitators and/or petrol precipitators; those containing fatty substances must go through grease traps and those with sand through grit chambers. Acidic sewage must be neutralised. Pumps are generally to be made with Ex-protection.

What installation types are there in sewage technology?

Very different types of installations are used in submersible motor systems in municipal applications. The type of installation depends mainly on the application purpose and the investment volume.

Basically, there are three different main installation types:

- Wet well installation, stationary
- Wet well installation, portable
- Dry well installation, stationary

The pipe chamber installations are also required. The type of installation depends mainly on the requirements of the consultant and the operator. Different viewpoints have arisen, which are each justified in terms of the individual field of application.

Wet well installation or stationary tank installation

With wet well installation, the pump is installed in the fluid to be pumped. The motor is cooled by the circulating sewage. The advantage of this type of installation is low investment costs compared to the more sophisticated pumping station designs for dry-installed sewage pumps. In such a case, a construction above ground or an intermediate base in the pump chamber for the pumps is not required. In greater depths, an intermediate ceiling is necessary.

The pump is fastened by means of a suspension unit with lowering mechanism. That allows the pump to be "pulled" at all times, e.g. for maintenance work.

The coupling base and the elbow are usually cast in one piece. The guide consists of two pipes, thus preventing any twisting. The Wilo coupling connection is made in such a way that a lip prevents the seal ring from falling out.

The pressure pipe made of a galvanised steel pipe, or ideally of a stainless steel pipe, is fitted directly on the suspension unit via flanges and leads out of the pump chamber. The pump chamber can be made at low costs from ready-made concrete pump chambers equipped with elastomer seals in accordance with EN 1917 (national addition: DIN 4034 T1). However, one-piece PEHD pump chambers without joints are a better solution, since these prevent any infiltration of external water.

As shown on the diagram alongside, this installation type gives the operator the option of special pump chamber geometries adjusted to individual requirements, the use of additional flushing valves or the installation of vortex impellers with special mixer head technology.

The disadvantage of a wet well installation is the lack of ease of maintenance. In addition, with a wet-installed submersible sewage pump, the water level can only be lowered to a certain level, since optimum cooling of the motor is only possible in submerged condition.

Stationary dry well installation

The dry well installation variant, in particular the dry-installed submersible pump, provides a number of advantages compared to dry-installed pumps, and also compared to wet-installed submersible pumps.

Installation principle of a dry-installed submersible pump

The main difference from a wet-installed submersible pump is the design of the motor. It is a fully encapsulated motor with internal closed-circuit cooling. A distinction is made between an open cooling system and a closed cooling system. With an open cooling system, the fluid to be pumped is used as the coolant. With a closed system (single-chamber or two-chamber system), cooling is performed by an external fluid, such as water-glycol or medical white oil, in a closed circuit.

Another main difference from the wet-installed submersible pump is that the dry-installed submersible pump is not installed in the fluid to be pumped. In terms of the technical construction, an intermediate base is required directly in the pumping station. The major advantages are the combination. On the one hand, this submersible pump offers all the benefits of a dry-installed pump and, on the other hand, all the benefits of a submersible pump, such as being overflow-proof.

As already mentioned, the pump is installed in a separate pump room. The pump is fastened to the inlet pipe unspectacularly via a pipe elbow.

Advantages compared to dry-installed pumps (no submersible pumps)

- Overflow-proof and thus more operational reliability
- Low-maintenance carbide mechanical seals or seal cartridges
- No couplings or V-belts, thus fewer wearing parts and less maintenance required
- Explosion protection possible at all times
- Clean and hygienic working conditions
- Easy maintenance

Portable installation

With this type of installation, the motor is cooled in the same way as for stationary wet well installation. However, the pump is not fastened firmly in the pump sump by means of a suspension unit. The pump can thus be installed in any pump chamber via a base component on the pump housing. With the right couplings, hoses of appropriate length can be installed on the pressure port. When selecting the pump, hydraulic conditions, such as volume flow and delivery head as well as the pump's NPSH, must also be taken into account.

Portable pumps are frequently used as emergency drainage or residual drainage pumps for municipal applications.

**What impeller shapes and properties are there?**

To ensure the fluid can be pumped reliably, the correct impeller must be used for the corresponding fluid. Each impeller shape has its advantages and disadvantages here. The following impeller shapes are currently used in our hydraulics:

- Single-vane impeller (single-channel impeller)
- Multi-vane impeller with 2, 3 or 4 channels (multi-channel impeller)
- Vortex impeller
- SOLID impeller
- Propeller impeller (axial impeller)

Single-channel and multi-channel impellers and the SOLID impellers are available in a closed and half open design. It should be noted here that the efficiency of the half open design is generally lower than that of the closed design.

In addition to the shape of the impeller the level of process reliability is also dependent on the nominal diameter of the hydraulics. Vortex impellers tend to be used for small nominal diameters (DN 50...150). Multi-channel impellers, on the other hand, tend to be used for large nominal diameters (DN 200...600).

Furthermore, there are hydraulics which are also equipped with a cutting device or a mechanical stirring apparatus. The additional cutting device breaks up the admixtures in the fluid, thereby facilitating the pumping process. The cutting device is installed internally or externally depending on the hydraulics selected, and it is combined with a half open single-channel impeller or a half open multi-channel impeller.

When using the additional mechanical stirring apparatus, the suction area is continuously stirred up. This prevents settlement of the solid material and the resulting encrustation. Due to the narrowly limited flow zone of the mixer head only the suction area of the pump is affected. The mechanical stirring apparatus is mostly used in combination with a vortex impeller.

When using the hydraulics, the following points must be observed:

- The fluid can exhibit a max. dry matter content (DM) of 8 %.
- The fluid must flow independently of the hydraulics.
- The friction losses in the discharge pipeline and the specific weight of the fluid must be taken into account in the calculations.
- The motor power is to be designed with an adequate reserve for the current operating conditions.

Vortex impeller

Recommended nominal diameters: DN 50 to DN 150

Properties:

- Very low-clogging, as it is insensitive to fluids containing fibres and textiles
- Very smooth operation
- High wear resistance
- Lower efficiency
- Suitable for pumping gaseous fluids
- Sludge pumping

Fields of application:

- Untreated sewage
- Activated sludge
- Raw and digested sludge
- Mixed water
- Fluids with problematic constituents and wearing constituents

Single-vane impeller (single-channel impeller)

Design: closed and half open

Recommended nominal diameters: DN 50 to DN 250

Properties:

- Low-clogging
- Smooth operation
- Wear-resistant
- Steep pump curve
- Good efficiency
- Sludge pumping

Fields of application:

- Untreated sewage
- Circulation and heating sludge
- Mixed water
- Raw and digested sludge
- Activated sludge

Double-vane impeller (multi-channel impeller)

Design: closed

Recommended nominal diameters: DN 150 to DN 400

Properties:

- Low-clogging (depending on nominal diameter and fluid)
- Very smooth operation
- Wear-resistant
- Steep pump curve
- Good efficiency
- Sludge pumping

Fields of application:

- Rake-cleaned sewage
- Mechanically treated sewage
- Industrial wastewater
- Landfill water
- Activated sludge
- Industrial sewage

Three and four-vane impeller (multi-channel impeller)

Design: closed

Recommended nominal diameters: DN 200 to DN 600

Properties:

- Low-clogging (depending on nominal diameter and fluid)
- Very smooth operation
- Steep pump curve
- Very good efficiency

Fields of application:

- Rake-cleaned sewage
- Mechanically treated sewage
- Industrial wastewater
- Landfill water
- Activated sludge
- Industrial sewage

SOLID impeller

Design: closed and half open

Recommended nominal diameters:

- Closed design: DN 150 to DN 400
- Half open design: DN 80 to DN 150

Properties:

- Closed design
 - Very low-clogging (depending on nominal diameter and flow rate)
 - Very smooth operation
 - Wear-resistant
 - Good efficiency
 - Pumping of gaseous fluids
 - Sludge pumping
- Half open design
 - Hardly any clogging
 - Lower efficiency than the closed design
 - Pumping of gaseous fluids
 - Sludge pumping

Fields of application:

- Untreated sewage
- Industrial wastewater
- Landfill water
- Activated sludge
- Industrial sewage

Propeller impeller (axial impeller)

Possible pipe diameters: 340 mm, 500 mm and 760 mm

Properties:

- Very smooth operation
- Very steep pump curve
- Very good efficiency

Fields of application:

- Fluids with small amounts of dirt
- Rainwater
- Return activated sludge
- Circulation of activated sludge
- Water drawing units, etc.

THE FUTURE IS CONNECTED.
